

SOP – Phase 1: Baseline Stabilization

1. Purpose

The objective of Phase 1 is to transform a newly onboarded restaurant into a fully mapped, auditable, and controlled technical system. This phase establishes the digital foundation asset registries, compliance calendars, and risk classifications necessary to safely initiate Phase 2 Preventive Maintenance.

2. Entry & Exit Conditions

2.1 Entry Conditions

- Onboarding payment received and contract signed.
- Initial restaurant profile (ID and site info) created in the PAYA platform.

2.2 Exit Conditions (The "PAYA-Ready" Gate)

Phase 1 is complete only when:

- 100% of critical assets are QR-tagged and registered.
- A Baseline Status Report (official output) is delivered to the client.
- A preventive maintenance plan (frequencies and rules) is configured.
- The site status is updated to **PAYA-Ready**.

3. Roles & Responsibilities

Role	Responsibility
Operations / KCC Desk	Owns execution oversight, data validation, compliance calendar builds, and maintenance strategy configuration.
Field Technician	Conducts physical audits, registers assets via QR tagging, identifies risks, and captures evidentiary data (photos/notes).
Restaurant Owner	Facilitates site access, provides historical compliance documentation, and reviews baseline findings.

4. Phase 1 Workflow (Step-by-Step)

4.1 Preparation & Initial Walkthrough

1. **Work Order Generation:** Operations prepares the baseline work order, including asset templates and QR packs.
2. **Site Arrival:** Technician arrives on-site, performs an access check, and ensures PPE compliance.
3. **Opening Meeting:** Technician confirms operating hours and access constraints with the manager.
4. **System Walkthrough:** Technician identifies critical zones and operational bottlenecks.

4.2 Asset Registration & QR Tagging

1. **Digital Enrollment:** Technician creates a digital record for every asset.
2. **Physical Tagging:** A unique QR code is applied to each asset to ensure future traceability.
3. **Condition Capture:** Technician records photos, nameplate data, and initial observations for every registered unit.

4.3 Compliance & Risk Profiling

1. **Compliance Capture:** Technician collects existing legal documents (Fire, Gas, Electrical) and performs a physical cross-check.
2. **Risk Classification:** Each asset is classified using the PAYA Risk Scale: **Red** (Safety-Critical), **Orange** (High Risk), **Yellow** (Degraded), or **Green** (Normal).

5. Escalation & Quality Control

5.1 Safety-Critical Issues (Red Flags)

Identification: If any red/safety-critical issues are found:

- **Immediate Escalation:** Technician alerts Operations instantly.
- **Same-Day Decision:** Operations mandates emergency dispatch or temporary mitigation.
- **Authorization:** Safety actions proceed **without** requiring prior client approval.

5.2 Non-Critical Corrective Actions

- For non-critical issues, Operations reviews the findings and proposes a corrective approach.
- **Client Approval:** Client approval is strictly required for non-critical corrective actions only.

6. The Transition to Phase 2 (Handover)

Once baseline data is synced and validated:

1. **Compliance Calendar:** Operations builds the legal obligations calendar based on recorded expiry dates.
2. **Baseline Status Report:** A final PDF and dashboard update are delivered to the client.
3. **Preventive Configuration:** Maintenance frequencies and tier rules are set.
4. **Scheduling:** Operations assigns technicians and populates the preventive calendar.
5. **Activation:** Restaurant status is updated to **PAYA-Ready**, automatically triggering the **Phase 2 – Preventive Operations Cycle**.

7. Key Control Principles

- **No Asset Left Behind:** If an asset is not QR-tagged, it does not exist in the PAYA control system.
- **Sanity Check:** Operations must validate the consistency of all incoming data before closing Phase 1.
- **Quality Gate:** Phase 2 cannot be activated until the "Baseline Data Complete" gate is satisfied.

SOP – Phase 2: Preventive Operations Cycle

1. Purpose

To transition from reactive maintenance to a **closed-loop preventive control cycle**. This ensures continuous asset uptime, compliance, and adaptive maintenance frequency based on real-time health data.

2. Roles & Responsibilities

Role	Primary Responsibility
Operations / KCC Desk	Owns scheduling, tech assignment , and quality gate validation.
Field Technician	Executes on-site checklists , records evidence , and logs minor corrective actions.
Restaurant Owner	Provides "No-Coordination" access and approves non-critical corrective proposals.

3. The Preventive Workflow

3.1 Scheduling & Assignment

- **Trigger:** The Operations/KCC Desk monitors the active preventive maintenance schedule.
- **Generation:** Work orders are generated based on asset criticality, risk scores, and contract tier.
- **Assignment:** Operations assigns a technician based on skill match and load balancing.
- **Confirmation:** The Technician must acknowledge and accept the work order.
 - *Decision:* If NOT accepted, Operations must immediately reassign or reschedule.

3.2 On-Site Execution & Evidence Collection

- **Arrival:** Technician arrives on-site, confirms access, and performs a PPE/Safety check.

- **Verification:** Tasks are executed using a QR-verified asset checklist.
- **Documentation:** During execution, the technician **must** record:
 - Precise measurements.
 - High-resolution photos.
 - General observations of asset condition.

3.3 Abnormality Handling (The "Within-Scope" Rule)

If the technician identifies an abnormality:

1. **Minor/In-Scope:** If the fix is within the PM scope, the technician performs the corrective action immediately and logs the evidence.
2. **Major/Out-of-Scope:** If the fix is outside the PM scope, the technician opens a defect ticket and escalates to Operations. **No unauthorized work is performed.**

4. Quality Gates & Escalation

4.1 Data Quality Gate (Operations Control)

Before a task is closed, the KCC Desk verifies the evidence:

- **Incomplete Evidence:** If QR scans, photos, or measurements are missing, the task is re-opened for technician clarification.
- **Complete Evidence:** Task is synced to the PAYA platform.

4.2 Safety-Critical Escalation

Operations classifies all defects found during the PM:

- **Safety-Critical:** Immediate escalation. Requires same-day intervention (e.g., emergency dispatch). **Client approval is not required** to proceed with safety-critical mitigation.
- **Non-Critical:** A corrective proposal is sent to the Restaurant Owner. The owner must **Approve or Reject** the proposal before a corrective work order is generated.

5. Continuous Improvement Loop

Phase 2 does not just maintain; it adapts. After every cycle:

- **Asset Health:** Update health trends and risk scores based on PM results.
- **Frequency Adjustment:** If an asset consistently shows high health scores, maintenance frequency may be reduced. If risk scores rise, frequency is increased.
- **Sync:** All data is pushed to the PAYA platform to inform the next generation of work orders.

6. Exit & Continuity

- **Terminal Exit:** None. This is a continuous cycle.
- **Pause Conditions:** Operations may pause the cycle only if the contract is terminated or the site is undergoing a "re-baselining" phase.
